VSP - Security

Last Updated: Apr 03, 2017 09:32AM AEST

The following information is provided by Availability Solutions to assist you assess you security requirements - from a Mimix/VSP perspective.

When Mimix (and the VSP) is installed - there are no restriction on which OS400 USERS can perform VSP functions.

We believe that Mimix customers should consider restricting the VSP functions to a specific subset of your users - in line with the users overall job role and system responsibility.

In order to direct Availability Solutions how you want your VSP security to work, you will need to provide the following:

- **A list of Users that you require to be able to MANAGE the VSP instance**
- **A list of Users that you require to be able to DISPLAY the VSP instance**
- **Your company SMTP email server settings**
- **A list of whom should be alerted via email when Mimix encounters issues**

Once you have provided this information , Availability Solutions will be able to tailor your VSP access to ensure that ONLY the specified people can perform those functions. As part of this service - we recommend setting the general access to the VSP to require manual addition of individual USERS to restrict access via the VSP.

In addition, we recommend adding an OS400 *USRPRF (with limited capability) to facilitate the automated distribution of VSP email alerts.

Security set up is not a simple task & will need to be reviewed and adjusted regularly.
